~Aœ New Approach to Nocturnal Enuresis

This book is an excellent resource for Chinese Medical practitioners interested in including paediatrics in their practice. It is built around numerous Chinese studies on the treatment of enuresis, enabling the reader to view and treat the problem from various perspectives. How
to put all this knowledge into practice is demonstrated in quite a few well-structured case histories. An introductory section on the Western view on pathology and treatment of bed-wetting offers the most up-to-date information in an easily readable format. This book takes the integration of Western and Chinese medical approaches one step further. Through the use of some of the recommended treatments offered in this compassionate and thoughtful book, the practitioner will discover just how rapid and successful TCM can be in treating this difficult (for parents as well as the child) condition.

**Stop Bedwetting in Seven Days**

A compact, “how-to” manual on effective, evidence-based treatments for enuresis and encopresis. The aim of this book is to provide readers with a practical overview of the definitions, characteristics, theories and models, diagnostic and treatment recommendations, and relevant aspects and methods of evidence-based psychosocial treatments for encopresis and enuresis, primarily in children. Although treatments and research for elimination disorders are reviewed in general, particular attention is directed at constipation and encopresis, toileting refusal, and diurnal and nocturnal enuresis due to the high incidence of these conditions in children. Case vignettes, websites, and suggestions for further reading are provided for the interested reader.

**Nocturnal Enuresis**

Excerpt from Nocturnal Enuresis and Incontinence of Urine The list might be greatly extended. But such are a few of the causes which have been noticed as giving rise to it. It is evident, therefore, that it is futile to prescribe any routine course of treatment until a careful study of each case is made, and the point of origin of the disease determined. To the removal of that exciting cause the treatment should be at once directed. The enuresis being but a consequent or secondary pathological condition. Would be a matter for subsequent consideration. In glancing over the list of causes, it is apparent that, diverse as these may be, they can only act by giving rise to one of three prime conditions, viz: Atony or paralysis of the bladder itself, permitting over distension and resulting in stillicidium. Elimination Disorders in Children and Adolescents

Bedwetting In Children & Teens

A comprehensive review of enuresis, such as this, has long been overdue. In this book attention is given to bladder control, reflecting current interest in developmental aspects of paediatrics, and to enuresis, reflecting the need to relieve a common cause of unhappiness. The topics discussed include how most children become dry by age four or five, and why a minority do not; why these children go on wetting their beds, and why some start doing so after a period of dryness. The prevalence of bedwetting in younger children varies curiously in different countries. Treatment, by explanation, by drugs and by the buzzer, is well covered in practical detail. Previously published articles are reviewed. In too many it has been difficult to determine whether authors are consistently writing about day-time or night-time, life-long or acquired, wetting. Emphasis is given to papers in which soundly based research is clearly reported. Though this book was inspired by and derives from a recent International Colloquium at Newcastle, it is anything but a report of that Colloquium. To extend coverage and avoid repetition, a number of chapters have been specially written, and papers have been re-written, fused or omitted; several up-to-date, comprehensive and authoritative reviews have been included. Whether readers are community, hospital or family doctors, or psychologists, they can enjoy criticising and evaluating the at times differing views put forward, and can synthesise their own new and better conclusions. The editors have aimed to clear the way for further research by identifying clearly what is known and posing questions. Equally, however, it is hoped that this volume will promote a deeper and better understanding of bladder control and enuresis, and enable doctors who use it for reference to give more effective help to children with wetting problems.
Simple Steps to Dry Nights

The child's role in treatment has until recently been neglected, with only the clinician's and parents' views being seriously considered. Recent work has demonstrated that the child's contribution is essential in designing effective intervention.

Lower urinary tract dysfunction (LUTD) is an umbrella diagnosis that covers the abnormalities of anatomy and function in the bladder, urethra, and, in men, the prostate. People with LUTD face a number of social, mental, and physical health effects due to the symptoms. Despite the increasing evidence in the assessment and management of lower urinary tract symptoms, it remains a challenge to bridge the gap between research evidence and clinical practice. In this book, each and every one of the authors presents a remarkable work for how to apply the evidence to clinical practice from different aspects. I hope this book is a key for every reader to open the door to LUTD.

Pediatric incontinence: evaluation and clinical management offers urologists practical, 'how-to' clinical guidance to what is a very common problem affecting up to 15% of children aged 6 years old. Introductory chapters cover the neurophysiology, psychological and genetic aspects, as well as the urodynamics of incontinence, before it moves on to its core focus, namely the evaluation and management of the problem. All types of management methods will be covered, including behavioural, psychological, medical and surgical, thus providing the reader with a solution to every patient’s specific problem. The outstanding editor team led by Professor Israel Franco, one of the world’s leading gurus of pediatric urology, have recruited a truly stellar team of contributors each of whom have provided first-rate, high-quality contributions on their specific areas of expertise. Clear management algorithms for each form of treatment support the text, topics of controversy are covered openly, and the latest guidelines from the ICCS, AUA and EAU are included throughout. Perfect to refer to prior to seeing patients on the wards and in the clinics, this is the ideal guide to the
topic and an essential purchase for all urologists, pediatric urologists and paediatricians managing children suffering from incontinence.

**Pediatric Incontinence**

Background and Aims: Bedwetting is the most common childhood complaint and it is important to ask children and their parents about nocturnal incontinence during health visit at 5 years of age. Aim was to analyze patients with primary nocturnal enuresis (PNE) in our pediatric practice.

Methods: We collected electronic data of children 5 years of age, descriptive statistical analysis was used.

Results: Out of 100 patients 5 years of age 7 had PNE (7%), 5 boys, 2 girls. In only 2 cases parents referred the problem themselves during regular health visit, in all other cases only when asked if the child had bedwetting. Two children (28,6%) had both enuretic parents, 4 children (57,1%) had 1 enuretic parent (father in all cases) and 1 child had no family history of PNE. Pediatric and neurological exam and blood pressure were normal in all children. All patients had normal urin analysis and normal ultrasound of the urinary system. Parents were advised to keep voiding diaries. All patients had nocturnal polyuria. Five patients (71,4%) were administered Desmopressin acetate (Minirin 120ug) for 3 months with no relapse. Two patients (28,6%) were recommended alarm devices.

Conclusion: It is important to address and treat PNE because if unrecognized the problem worsens and can result in emotional stress.
